Can a combination box be installed near a solar array?

The solar array input strings may be combined, yet only a single pair of wires is required between the Combiner Box and the PV controller location.

Do you need a solar combiner box?

A solar combiner box is unnecessary for projects with two or three strings. Instead, it would help if you connected the string to the inverter. Combiner boxes are perfect for huge projects that have over 4000 strings. Different sized boxes are used in commercial applications to procure power from abnormal building layouts.

Where should a solar combiner box be located?

The combiner box should reside between the solar modules and inverter. When optimally positioned in the array, it can limit power loss. Position can also be important to price. Location is highly important because a combiner in a non-optimal location may potentially increase DC BOS costs from losses in voltage and power, Kane explained.

How do you connect a solar array to a combiner box?

When connecting the wires from the solar array to the combiner box, ensure you connect them properly. The positive wire should go into the positive terminal of the DC input. Then, the negative wire should go into the negative terminal. Failure to connect the wires to the right terminal will cause a short circuit.
